Day 8 Assignment

Description:

This project implements a React-based book listing platform where users can:

- View featured academic books
- Toggle between Grid and List view layouts
- Search and filter books dynamically
- View book details including image, author, and price (₹)

The project uses React functional components with Hooks for state management. Props are used to pass data between components, and controlled components are implemented for handling user input. The application demonstrates conditional rendering and responsive UI design.

Objective:

The primary objectives of this assignment were:

- To understand the fundamentals of React and JSX
- To create and use functional components
- To pass data using props between components
- To manage state using the useState Hook
- To implement event handling in React
- To build a controlled search input component
- To design a responsive and professional user interface

Bookcard :

```
bookverse > src > components > JS BookCard.js > default
import React from "react";

function BookCard({ title, author, price, image }) {
  return (
    <div className="book-card">
      <img src={image} alt={title} className="book-image" />
      <h3 className="book-title">{title}</h3>
      <p className="book-author">By: {author}</p>
      <p className="book-price">₹ {price}</p>
    </div>
  );
}

export default BookCard;
```

Booklist Parent Component :

```
  return (
    <div className="booklist-container">
      <div className="controls">
        <input
          type="text"
          placeholder="Search books..."
          value={search}
          onChange={(e) => setSearch(e.target.value)}
          className="search-box"
        />
        <div className="view-buttons">
          <button
            className={view === "grid" ? "active" : ""}
            onClick={() => setView("grid")}
          >
            Grid View
          </button>
          <button
            className={view === "list" ? "active" : ""}
            onClick={() => setView("list")}
          >
            List View
          </button>
        </div>
      </div>

      <div className={view === "grid" ? "grid-container" : "list-container"}>
        {filteredBooks.map((book) => (
          <BookCard
            key={book.id}
            title={book.title}
            author={book.author}
            price={book.price}
            image={book.image}
          />
        ))}
      </div>
    </div>
  );
}

export default BookList;
```
