Day 9 Assignment

Description:

This project enhances the BookVerse React application by implementing component composition and advanced React concepts. The application allows users to interact with book cards and view detailed information about the author.

The platform provides the following features:

- Click on a book card to view author details including biography and top books
- Display author information using a separate AuthorInfo component
- Focus the search input field using React refs (uncontrolled component)
- Validate component props using PropTypes

The project also demonstrates the use of class components and lifecycle methods such as **componentDidMount**. Bootstrap and CSS styling are applied to create a responsive and visually structured layout. The application is built using reusable components like BookCard, AuthorInfo, and BookList to maintain a modular and scalable design.

Objective:

The primary objectives of this assignment were:

- To understand the concept of component composition in React
- To implement and work with React class components
- To demonstrate lifecycle methods such as componentDidMount
- To validate component properties using PropTypes
- To implement React refs for uncontrolled component behavior
- To integrate Bootstrap with React for responsive layouts
- To structure the application using reusable and composable components
